Functions 2: Using Functions

To **call** or **execute** or **evaluate** a function means to run its code with specific inputs (if the function takes inputs).

Suppose this function has been defined:

```javascript
function add(num1, num2) {
  let sum = num 1 + num2;
  return sum;
}
```

Call a function

Inputs are assigned to parameters; order matters

The result of evaluating a function is its return value

Use a variable to store the result of evaluating a function
